# Overview

This document has code embedded throughout. In the next section we will create a visualization using the already loaded dataset `eth_data`:

```
datatable(eth_data)
```

# Price Chart - Ethereum

## Python Code Example

```
import pandas as pd
# Create the Python object from R
df = r.cryptodata
# Show the new Python dataframe
df
```

```
##           pair symbol  ask_1_price      date_time_utc
## 0      BTCUSD    BTC      50240.000 2021-02-24 06:00:01
## 1      ETHUSD    ETH       1617.737 2021-02-24 06:00:01

## One more Python example

The code below creates a new column `price_percentile` that specifies if the price for the row was in the upper or lower 50th percentile of prices (BTC should be upper and ETH lower):

```
import numpy as np
# Create a new column based on the ask_1_price value:
df['price_percentile'] = np.where(df['ask_1_price'] >
                                   np.percentile(df['ask_1_p
                                   'upper 50th percentile of price
                                   'lower 50th percentile of price

# Show modified dataframe:
df[['symbol', 'ask_1_price', 'price_percentile']]
```

##	symbol	ask_1_price	price_percentile
## 0	BTC	50240.000	upper 50th percentile of price
## 1	ETH	1617.737	lower 50th percentile of price
## 2	ETH	1630.906	lower 50th percentile of price
## 3	BTC	50617.340	upper 50th percentile of price
## 4	ETH	1632.040	lower 50th percentile of price
