Overview

This document has code embedded throughout. In the next section we will create a visualization using the already loaded dataset eth_data:

datatable(eth_data)

Price Chart - Ethereum

Python Code Example

.. ..

```
import pandas as pd
# Create the Python object from R
df = r.cryptodata
# Show the new Python dataframe
df
```

One more Python example

The code below creates a new column price_percentile that specifies if the price for the row was in the upper or lower 50th percentile of prices (BTC should be upper and ETH lower):

```
import numpy as np
# Create a new column based on the ask 1 price value:
df['price percentile'] = np.where(df['ask 1 price'] >
```

np.percentile(df['ask_1_] 'upper 50th percentile of price 'lower 50th percentile of price # Show modified dataframe:

df[['symbol', 'ask_1_price', 'price_percentile']] ask_1_price price_percenti ## symbol ETH 565.682 lower 50th percentile of price ## 0

18748.340 upper 50th percentile of price ## 1 BTC ETH 567.839 lower 50th percentile of price ## 2 ## 3 BTC 18807.890 upper 50th percentile of price ## / ETI E70 000 larram EO+h namaan+ila af nmia
