Overview

This document has code embedded throughout. In the next section we will create a visualization using the already loaded dataset eth_data:

datatable(eth_data)

Price Chart - Ethereum

Python Code Example

```
import pandas as pd
# Create the Python object from R
df = r.cryptodata
# Show the new Python dataframe
df
```

##		pair	symbol	ask_1_price	date_time_utc
##	0	ETHUSD	ETH	2147.049	2021-07-03 06:00:01
##	1	BTCUSD	BTC	33712.780	2021-07-03 06:00:00
##	2	ETHUSD	ETH	2139.500	2021-07-03 05:00:01
##	3	BTCUSD	BTC	33674.690	2021-07-03 05:00:00
##	4	ETHUSD	ETH	2131.294	2021-07-03 04:00:01
##					
##	14807	BTCUSD	BTC	11972.900	2020-08-10 06:03:50
##	14808	BTCUSD	BTC	11985.890	2020-08-10 05:03:48
##	14809	BTCUSD	BTC	11997.470	2020-08-10 04:32:55
##	14810	BTCUSD	BTC	10686.880	NaT
##	14811	ETHUSD	ETH	357.844	NaT

One more Python example

The code below creates a new column price_percentile that specifies if the price for the row was in the upper or lower 50th percentile of prices (BTC should be upper and ETH lower):

```
import numpy as np
# Create a new column based on the ask 1 price value:
df['price percentile'] = np.where(df['ask 1 price'] >
```

np.percentile(df['ask_1_] 'upper 50th percentile of price 'lower 50th percentile of price # Show modified dataframe:

df[['symbol', 'ask_1_price', 'price_percentile']] ## symbol ask_1_price price_percent: ETH 2147.049 lower 50th percentile of price ## 0

33712.780 upper 50th percentile of price ## 1 BTC ETH 2139.500 lower 50th percentile of price ## 2 ## 3 BTC 33674.690 upper 50th percentile of price ## / TTT 2121 201 larram EO+h mamaan+ila af nmi
