R Markdown Output

Overview

This document has code embedded throughout. In the next section we will create a visualization using the already loaded dataset eth_data:

datatable(eth_data)

Price Chart - Ethereum

Python Code Example

##
## [5606 rows x 4 columns]
```

One more Python example

The code below creates a new column price_percentile that specifies if the price for the row was in the upper or lower 50th percentile of prices (BTC should be upper and ETH lower):

```
import numpy as np
# Create a new column based on the ask_1_price value:
df['price_percentile'] = np.where(df['ask_1_price'] >
                                  np.percentile(df['ask_1_price'], 50),
                            'upper 50th percentile of prices',
                            'lower 50th percentile of prices')
# Show modified dataframe:
df[['symbol', 'ask_1_price', 'price_percentile']]
##
        symbol
                ask_1_price
                                            price_percentile
## O
           BTC
                  23525.000 upper 50th percentile of prices
                    615.130 lower 50th percentile of prices
## 1
           ETH
## 2
           BTC
                  23446.650 upper 50th percentile of prices
                    617.556 lower 50th percentile of prices
## 3
           ETH
## 4
           ETH
                    623.627 lower 50th percentile of prices
## ...
                  11972.900 upper 50th percentile of prices
## 5601
           BTC
## 5602
                  11985.890 upper 50th percentile of prices
           BTC
## 5603
           BTC
                  11997.470 upper 50th percentile of prices
                  10686.880 upper 50th percentile of prices
## 5604
           BTC
## 5605
           ETH
                    357.844 lower 50th percentile of prices
##
## [5606 rows x 3 columns]
```
