#### Overview

This document has code embedded throughout. In the next section we will create a visualization using the already loaded dataset eth\_data:

datatable(eth\_data)

#### Price Chart - Ethereum

# Python Code Example

```
import pandas as pd
# Create the Python object from R
df = r.cryptodata
# Show the new Python dataframe
df
```

##		pair	symbol	ask_1_price	date_	time_utc
##	0	BTCUSD	BTC	34822.380	2021-07-07	06:00:01

##	15002	BTCUSD	BTC	10686.880		NaT
##	15003	ETHUSD	ETH	357.844		NaT

# One more Python example

## 1

The code below creates a new column price\_percentile that specifies if the price for the row was in the upper or lower 50th percentile of prices (BTC should be upper and ETH lower):

```
import numpy as np
# Create a new column based on the ask 1 price value:
df['price percentile'] = np.where(df['ask 1 price'] >
```

np.percentile(df['ask\_1\_] 'upper 50th percentile of price 'lower 50th percentile of price # Show modified dataframe: df[['symbol', 'ask\_1\_price', 'price\_percentile']]

```
symbol
##
                 ask_1_price
                                               price_percent:
            BTC
                    34822.380
                               upper 50th percentile of price
## 0
```

lower 50th percentile of price
