#### Overview

This document has code embedded throughout. In the next section we will create a visualization using the already loaded dataset eth\_data:

datatable(eth\_data)

#### Price Chart - Ethereum

## Python Code Example

```
import pandas as pd
# Create the Python object from R
df = r.cryptodata
# Show the new Python dataframe
df
```

##		pair	symbol	ask_1_price	$\mathtt{date\_time\_utc}$
##	0	ETHUSD	ETH	1929.037	2021-06-24 06:00:01
##	1	BTCUSD	BTC	32979.870	2021-06-24 06:00:00
##	2	BTCUSD	BTC	32539.120	2021-06-24 05:00:01
##	3	ETHUSD	ETH	1904.791	2021-06-24 05:00:01
##	4	ETHUSD	ETH	1904.908	2021-06-24 04:00:01
##					
##	14375	BTCUSD	BTC	11972.900	2020-08-10 06:03:50
##	14376	BTCUSD	BTC	11985.890	2020-08-10 05:03:48
##	14377	BTCUSD	BTC	11997.470	2020-08-10 04:32:55
##	14378	BTCUSD	BTC	10686.880	NaT
##	14379	ETHUSD	ETH	357.844	NaT

# One more Python example

ETH

TTT

## /

The code below creates a new column price\_percentile that specifies if the price for the row was in the upper or lower 50th percentile of prices (BTC should be upper and ETH lower):

```
import numpy as np
# Create a new column based on the ask 1 price value:
df['price percentile'] = np.where(df['ask 1 price'] >
                                  np.percentile(df['ask_1_]
```

'upper 50th percentile of price 'lower 50th percentile of price # Show modified dataframe: df[['symbol', 'ask\_1\_price', 'price\_percentile']]

## symbol ask\_1\_price price\_percent: ETH 1929.037 lower 50th percentile of price ## 0 BTC 32979.870 upper 50th percentile of price ## 1 BTC 32539.120 upper 50th percentile of price ## 2

lower 50th percentile of price
