Overview

This document has code embedded throughout. In the next section we will create a visualization using the already loaded dataset eth_data:

One more Python example

The code below creates a new column `price_percentile` that specifies if the price for the row was in the upper or lower 50th percentile of prices (BTC should be upper and ETH lower):

```
import numpy as np
# Create a new column based on the ask_1_price value:
df['price_percentile'] = np.where(df['ask_1_price'] >
                              np.percentile(df['ask_1_p
                       'upper 50th percentile of price
                       'lower 50th percentile of price
# Show modified dataframe:
df[['symbol', 'ask_1_price', 'price_percentile']]
```

```
##      symbol   ask_1_price                      price_percentil
## 0      BTC     33751.550  upper 50th percentile of price
## 1      ETH      1319.072  lower 50th percentile of price
## 2      BTC     33557.080  upper 50th percentile of price
## 3      ETH      1314.518  lower 50th percentile of price
## 4      ETH      1315.405  lower 50th percentile of price
```
