Overview

This document has code embedded throughout. In the next section we will create a visualization using the already loaded dataset eth_data:

```
datatable(eth_data)
```

Python Code Example

```python
import pandas as pd
# Create the Python object from R
df = r.cryptodata
# Show the new Python dataframe
df
```

```

One more Python example

The code below creates a new column `price_percentile` that specifies if the price for the row was in the upper or lower 50th percentile of prices (BTC should be upper and ETH lower):

```python
import numpy as np
# Create a new column based on the ask_1_price value:
df['price_percentile'] = np.where(df['ask_1_price'] >
                                  np.percentile(df['ask_1_p
                      'upper 50th percentile of price
                      'lower 50th percentile of price
# Show modified dataframe:
df[['symbol', 'ask_1_price', 'price_percentile']]
```

```
##      symbol  ask_1_price                    price_percenti
## 0       BTC    60843.190  upper 50th percentile of pric
## 1       ETH     2171.118  lower 50th percentile of pric
## 2       BTC    61059.430  upper 50th percentile of pric
## 3       ETH     2190.880  lower 50th percentile of pric
## 4       ETH     2146.463  lower 50th percentile of pric
```
