Overview

This document has code embedded throughout. In the next
section we will create a visualization using the already loaded
dataset eth_data:

```

One more Python example

The code below creates a new column `price_percentile` that specifies if the price for the row was in the upper or lower 50th percentile of prices (BTC should be upper and ETH lower):

```python
import numpy as np
# Create a new column based on the ask_1_price value:
df['price_percentile'] = np.where(df['ask_1_price'] >
                            np.percentile(df['ask_1_p
                    'upper 50th percentile of price
                    'lower 50th percentile of price
# Show modified dataframe:
df[['symbol', 'ask_1_price', 'price_percentile']]
```

```
##      symbol  ask_1_price                      price_percentil
## 0       BTC    49660.000  upper 50th percentile of price
## 1       ETH     1560.878  lower 50th percentile of price
## 2       BTC    49043.890  upper 50th percentile of price
## 3       ETH     1537.090  lower 50th percentile of price
## 4       ETH     1554.051  lower 50th percentile of price
```
