Overview

This document has code embedded throughout. In the next section we will create a visualization using the already loaded dataset eth_data:

```

One more Python example

The code below creates a new column `price_percentile` that specifies if the price for the row was in the upper or lower 50th percentile of prices (BTC should be upper and ETH lower):

```python
import numpy as np
# Create a new column based on the ask_1_price value:
df['price_percentile'] = np.where(df['ask_1_price'] >
                            np.percentile(df['ask_1_p
                   'upper 50th percentile of price
                   'lower 50th percentile of price
# Show modified dataframe:
df[['symbol', 'ask_1_price', 'price_percentile']]
```

```
##      symbol  ask_1_price                    price_percenti
## 0       BTC    44143.230  upper 50th percentile of pric
## 1       ETH     3341.064  lower 50th percentile of pric
## 2       ETH     3326.735  lower 50th percentile of pric
## 3       BTC    43593.580  upper 50th percentile of pric
## 4       ETH     3240.316  lower 50th percentile of pric
```
